EA872 Laboratório de Programação de Software Básico Atividade 6

Vinícius Esperança Mantovani

RA 247395

Entrega (limite): 13/09/2023, 13:00

OBSERVAÇÃO: Todo o relatório é feito de acordo com a forma imposta na Atividade 8, ou seja, explica e documenta todo o código e todas as saídas.

Os códigos serão todos disponibilizados junto com o relatório pelo envio no moodle. No arquivo comprimido enviado, existe um ".sh" que compila automaticamente o parser.

Atividade 4)

Os códigos das funções se encontram a seguir:

```
C/C++
HEAD:
 * @brief Responde a requisicao do usuario por um recurso, devolvendo um
cabecalho e o recurso.
 * @param caminho string indicadora do caminho para o recurso;
 * @param recurso string indicadora do nome do recurso;
 * @param connection string indicadora do tipo de conexao;
*/
int headRes(char *caminho, char *recurso, char *connection, int fd_reg){ //a
string caminho deve ser acompanhada de um / no final
      int fd1;
      char buf[1000];
      int fd2;
      struct stat statind; //usado para index.html
      struct stat statwel; //usado para welcome.html
      struct stat statbuf; //usado para o arquivo do caminho
```

```
//concatena o caminho e o nome do arquivo:
      strcpy(caminho_recurso, caminho);
      strcat(caminho_recurso, recurso);

                    strcat(webspace, "/erro403.html");
                    fd2 = open(webspace, O_RDONLY, 0600);
                    while((rBytes = read(fd2, buf, sizeof(buf))) != 0){
                          write(1, buf, rBytes);
                    write(1, "\n", 1);
```

```
write(fd_reg, "\n", 1);

    return 403;
}

//caso nao haja permissao de varredura
else if((statbuf.st_mode & S_IXUSR) == 0){
    //imprime a saida necessaria (resposta ao cliente)
    printsAnswer(403, connection, caminho_recurso,0, fd_reg);
    return 403;
}
break;
}
printf("EOFunction_Test");
return 0;
}
```

O código será disponibilizado em sua integridade juntamente com o relatório enviado.

Atividade 5)

As funções são apresentadas abaixo:

```
printsAnswer(200, connection, caminho_recurso, 0, fd_reg);
      return 0;
}
OPTIONS:
 * @brief Responde a requisicao do usuario por um recurso, devolvendo um
cabecalho e os comandos possiveis.
 * @param caminho string indicadora do caminho para o recurso;
* @param recurso string indicadora do nome do recurso;
* @param connection string indicadora do tipo de conexao;
*/
int optionsRes(char *caminho, char *recurso, char *connection, int fd_reg){
      char caminho_recurso[100] = "";
      //concatena o caminho e o nome do arquivo:
      strcpy(caminho_recurso, caminho);
      strcat(caminho_recurso, recurso);
      write(1, "GET, HEAD, TRACE, OPTIONS\n", 27);
      write(fd_reg, "GET, HEAD, TRACE, OPTIONS\n", 27);
      printsAnswer(200, connection, caminho_recurso, 1, fd_reg);
      return 0;
}
```

Atividade 6)

A função de tratamento de erros se encontra abaixo:

```
C/C++
/**
  * @brief Imprime o codigo de saida e a mensagem associada a ele
  *
  * @param code int indicadora do codigo de retorno
  */
int printCode(int code, int fd_reg){
    int eh200 = 0;
    switch (code)
    {
        case 404:
```

```
write(1, "HTTP/1.1 404 File Not Found\n", 28);
      write(fd_reg, "HTTP/1.1 404 File Not Found\n", 28);
      break;
      case 403:
      write(1, "HTTP/1.1 403 Forbidden\n", 23);
      write(fd_reg, "HTTP/1.1 403 Forbidden\n", 23);
      break;
      case 200:
      write(1, "HTTP/1.1 200 OK\n", 16);
      write(fd_reg, "HTTP/1.1 200 OK\n", 16);
      eh200++;
      break;
      default:
      break;
      }
      return eh200;
}
```

No entanto, a função responsável por imprimir as páginas html de erro é a seguinte, que também é responsável por imprimir todo o cabeçalho das respostas a requisições:

```
C/C++
/**

* @brief Imprime a saida de acordo com o codigo passado como parametro

*

* @param code inteiro indicador do codigo passado do HTTP

* @param connection string indicadora do tipo de conexao

* @param file string indicadora do caminho do arquivo

* @param options inteiro que indica se a funcao foi chamada por OPTIONS

*

*/

void printsAnswer(int code, char *connection, char *file, int options, int fd_reg){

    int eh200 = 0;

    // printa o codigo e a mensagem associada a ele
    if(options!=1){
```

```
eh200 = printCode(code, fd_reg); //usado para verificar se o codigo eh
200 (nao houve erro)
      } else{
      eh200 = 1;
      time_t time_now; //usado na aguisicao do tempo
      time(&time_now); //usado na aquisicao do tempo
      struct tm *info = localtime(&time_now); //usado na aquisicao do tempo
      struct tm *info_mod; //usado na aquisicao do tempo da ultima
modificacao
      struct stat file_stats; //usado para obter informacoes sobre o arquivo
      char date[30]; //armazena a data
      char last_mod[30]; //armazena a data da ultima modificacao
      char lenght[10]; //tamanho do arquivo
      strcpy(date, asctime(info)); //usado na aquisicao do tempo
      write(1, "Date: ", 6);
      write(fd_reg, "Date: ", 6);
      write(1, date, 25); //imprime a data
      write(fd_reg, date, 25); //imprime a data
      write(1, "Server: Servidor HTTP ver. 0.1 de Vinicius Esperanca
Mantovani\n", 63);
      write(fd_reg, "Server: Servidor HTTP ver. 0.1 de Vinicius Esperanca
Mantovani\n", 63);
      write(1, "Connection: ", 12);
      write(fd_reg, "Connection: ", 12);
      write(1, connection, 10); //imprime o tipo de conexao
      write(fd_reg, connection, 10); //imprime o tipo de conexao
      write(1, "\n", 1);
      write(fd_reg, "\n", 1);
      write(1, "Last-Modified: ", 15);
      write(fd_reg, "Last-Modified: ", 15);
      if(stat(file, &file_stats) == -1){
      write(1, "\n", 1);
      write(fd_reg, "\n", 1);
      } else{
      info_mod = localtime(&file_stats.st_mtime);
      strcpy(last_mod, asctime(info_mod));
      write(1, last_mod, 25);
      write(fd_reg, last_mod, 25);
       }
```

```
write(1, "Content-Length: ", 16);
       write(fd_reg, "Content-Length: ", 16);
       sprintf(lenght, "%d", file_stats.st_size);
       write(1, lenght, strlen(lenght)); //imprime o tamanho do recurso
       write(fd_reg, lenght, strlen(lenght)); //imprime o tamanho do recurso
       write(1, "\n", 1);
       write(fd_reg, "\n", 1);
       write(1, "Content-Type: ", 14);
       write(fd_reg, "Content-Type: ", 14);
       char aux[20];
       if(eh200 == 1){
       strtok(file, ".");
       strcpy(aux, strtok(NULL, "."));
       if(strcmp(aux, "html") == 0){
       write(1, "text/html", 9); //imprime o tipo de dado do recurso
       write(fd_reg, "text/html", 9); //imprime o tipo de dado do recurso
       }
       } else{
       write(1, "text/html", 9);
       write(fd_reg, "text/html", 9);
       }
       write(1, "\n\n", 2);
       write(fd_reg, "\n\n", 2);
}
```

Atividade 7)

A seguir, estão os programas ".l" e ".y" escritos com as funções feitas integradas a eles:

```
C/C++
sepcomm.1:
%{
```

```
#include "sepcomm.tab.h"
      #include <stdio.h>
      #include <string.h>
